THIN VENEER™

THINBRICK • OLD BRICK ORIGINALS • ROBINSON ROCK • THINTRIM

1. Drywall/Cement Board
2. Thin-set Mortar/Adhesive
3. Thinbrick and Grout

Thinbrick™

Common Installation Method

There are many ways to install Thinbrick™ materials and the installation method depends on the wall or foundation to which the product is being applied. As building codes vary by region, it is important to check local building codes for proper installation guidelines. For more information regarding common methods of installation, refer to “Methods of Installation for Brick and Rock Thinveneers™.”

1. Rigid Wall
2. Weather Barrier
3. Metal Lath
4. Mortar
5. Robinson Rock

Thinrock™

Common Installation Method

There are many ways to install Robinson Rock™ and the installation method depends on the wall or foundation to which the product is being applied. As building codes vary by region, it is important to check local building codes for proper installation guidelines. While it is possible to simply open the box and begin directly installing Robinson Rock™, many masons prefer to lay out the product on the ground or floor to facilitate planning and to ensure an easier installation and design control. Mortar color selection will have a significant effect on the overall product appearance. Mortar joint dimension or elimination of the mortar joint (dry stacking) will affect the overall product appearance and the amount of material needed per square foot.

3

EASY STEPS

How to calculate the amount of Thin veneer you'll need:

1. Find the total square footage by measuring the width and height of the areas to be covered.
2. Estimate the corners by measuring the total length of wall corners to be covered. This will equal the number of linear feet of corners required.
3. Finally, subtract the corner square foot calculation from the total square feet to be covered. This will equal the number of square feet of flats required.
